

## AUXILIARY MILL DUTY DC MOTORS

KIRLOSKAR ELECTRIC

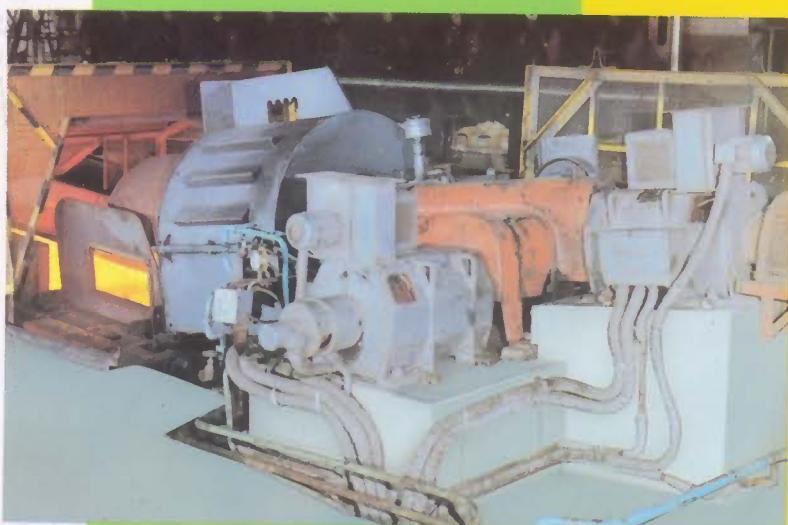

**K**irloskar Electric is a part of the century old Kirloskar group of industries manufacturing diversified products like electrical machines, machine tools, internal combustion engines, compressors, process control equipments, pumps etc., with a turnover of Rs.1250 crores and employing over 25000 people.

Kirloskar Electric manufactures the entire range of industrial electrics like DC Motors & Generators, AC Motors & Generators, Transformers, Motorised Gear Units, Industrial and Power Electronics and Computers.

The technological ability combined with a constant endeavour to produce quality electrical equipments have resulted in many mile stones and industrial developments.

Kirloskar Electric believes that the inherent strength of its organisation lies in its human resources. From its experienced engineers to its highly skilled work force, the Kirloskar Electric team is bound together by a common thread of quality consciousness and customer satisfaction.

**K**irloskar Electric has a wide product range of DC Machines to suit specific applications.

The AISE auxiliary Mill Duty DC Machines are being manufactured for nearly 20 years and has proved its mettle in the arduous working environment. With a tradition of leadership, Kirloskar Electric is the only manufacturer in India and one among the few in the world to produce laminated yoke version of 800 series AISE DC Motors.

To suit specific application needs all motors from 802 through 824 in various constructions and designs are available.

Application support for special requirements is a unique strength of Kirloskar Electric.

## General

Kirloskar Electric 800 series Mill Duty DC Motors conform on rating, performance and dimension to AISE standard no. 1 revised 1968, recognised by users all over the world.

There is a choice of rigid, non-split, solid yoke frame construction, split solid yoke and non-split laminated yoke to suit the application requirement.

Compensation windings are provided on frames 814 and above in non-split solid construction and on all frames above 808 in non-split laminated yoke machines.

A wide variety of designs are offered to suit full speed, half speed and quarter speed requirements at preferred armature voltages of 230, 400 & 460 V. Class 'H' insulation is employed with temperature rise limited to 75° K by resistance method over an ambient of 40° C for force ventilated continuous duty motors. For TENV - 1 hr duty the temperature rise is limited to 110° K over 40° amb by resistance method. Field winding however can be continuously ON, even when non-ventilated. (Working altitude of ≤1000 m). High overload capability is commensurate with the application needs.

(Table 1)

Maximum armature voltage of upto 700V is possible on most of the armature designs. Higher voltages can also be given on request. Field winding is designed for 600V insulation class. With nominal voltage at 230V, field forcing would be possible to achieve momentary peak torque.

## Nomenclature

	X M X D C	X X X
K - Solid Yoke		
L - Laminated Yoke		
		Frame designation as per AISE 802-824
	H for IC 0666	
	W for ICW 37 A86	
	S for IC 0041	
	None for IC 06	
	IC01	
	IC37	
	IC17	

Table : 1

P.U. Torque	% rated speed	
	230V	460V
3.0	200	100
2.5	250	140
2.0	300	200

(Higher values on request)

The permissible stall currents are:

P.U. Current	Time (Sec)
3.0	15
2.5	20
2.0	30
1.0	60
0.5	300
0.25	Continuous

Applicable for force ventilated motors

## Unique Features

- di/dt of 250 In/Sec on laminated yoke machines & 60 In/sec on solid yoke machines (Higher values on request)
- Choice of cooling IC 06, IC 17, IC 37, IC 0041, IC 0666, ICW 37-A 86. (Modular construction)
- TIG-brazed armature coil joints on request to suit very high overload requirements
- Vacuum-pressure Impregnation for increased reliability
- Armature constructed on sleeve permitting easy shaft replacement
- High tensile, toughened shaft
- Infrastructure covering design, manufacture and testing

## Design.

The electrical and mechanical designs are fully computerised. Optimisation of performance and reliability are ensured by analytical methods like the use of FEM technique. The selection of raw material is carefully done to achieve highest efficiency for the entire range of operation of speed, outputs and overloads.

## Magnet Frame

A choice of solid yoke split, uncompensated OR non-split, compensated OR laminated yoke compensated type of machines are available to the users, to suit specific requirements.

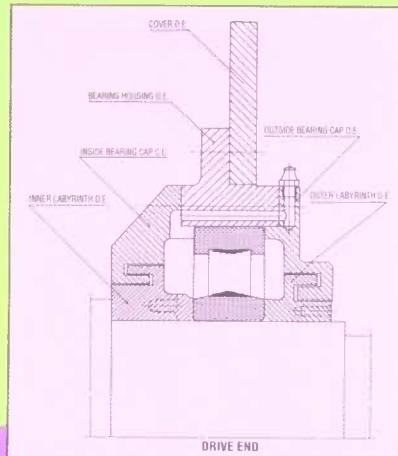

## Commutator

A special alloy is employed for the inhouse manufacture of Commutator ensuring proper dynamic seasoning and testing for the highest operating speeds. Computer aided design and availability of toolings for wide variety voltage - speed combination, results in quick deliveries and the highest quality standards.

## Field Coil

Special care is taken to make the Field Coils compact and effective on heat transfer. The fixing up of coils of the pole bricks and the pole coil assembly to the stator ensures vibration-free performance for reliability.

## Bearings

Anti friction bearings are used with careful selection made to suit the application needs. The lubrication for the bearings ensures satisfactory performance under the most arduous working condition. The design of the bearing assembly attempts a minimum of 20,000 hrs life for the specific application.

## Armature

Adequate precautions are taken in preparing the armature coils using automatic coil forming machine and insulating the same to the requirements under dust-free environment to provide the desired level of reliability.

Skilled technicians with continuous training are entrusted with the most critical operation of the DC Machine. The progress is verified at each step with stringent quality measures to prepare each armature for the ultimate duty class.

## Vacuum Pressure Impregnation

Carefully selected solventless resin employed for the vacuum pressure impregnation of armatures provides void-free treatment ensuring better heat transfer in addition to protecting the windings against influence of moisture, chemical fumes and other contaminations.

## Dynamic Balancing

Armatures are dynamically balanced to precision grade to ensure low vibration operation.

## TIG - Welding

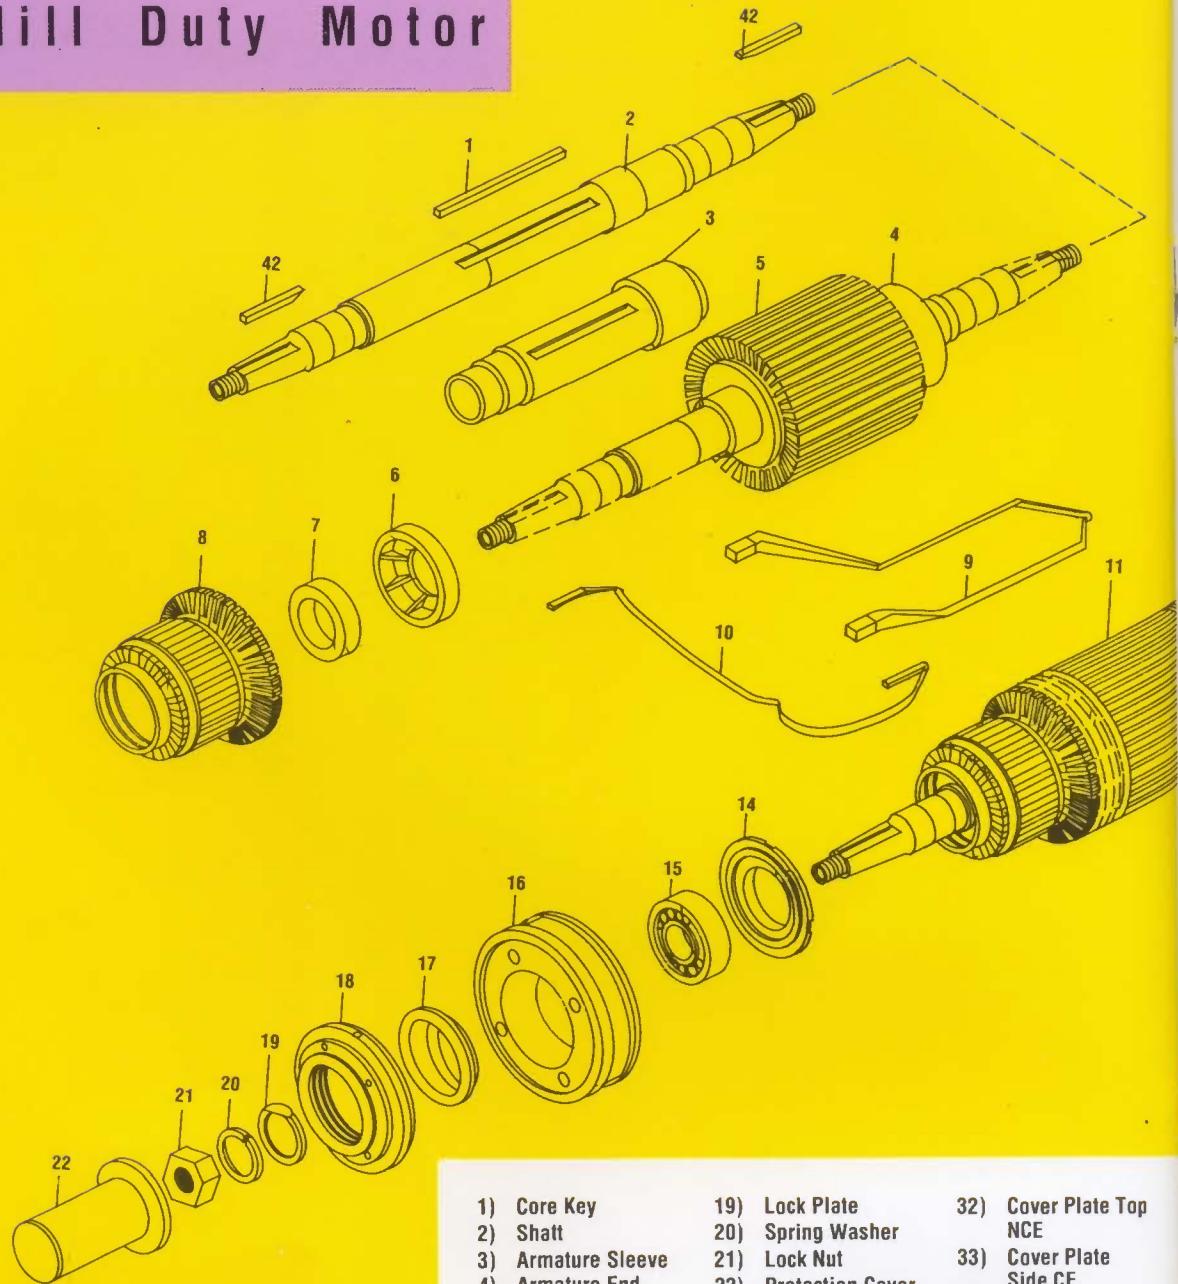

Choice of TIG-Welding joints for the armature coil to Commutator is available when very high currents are involved.

## Testing

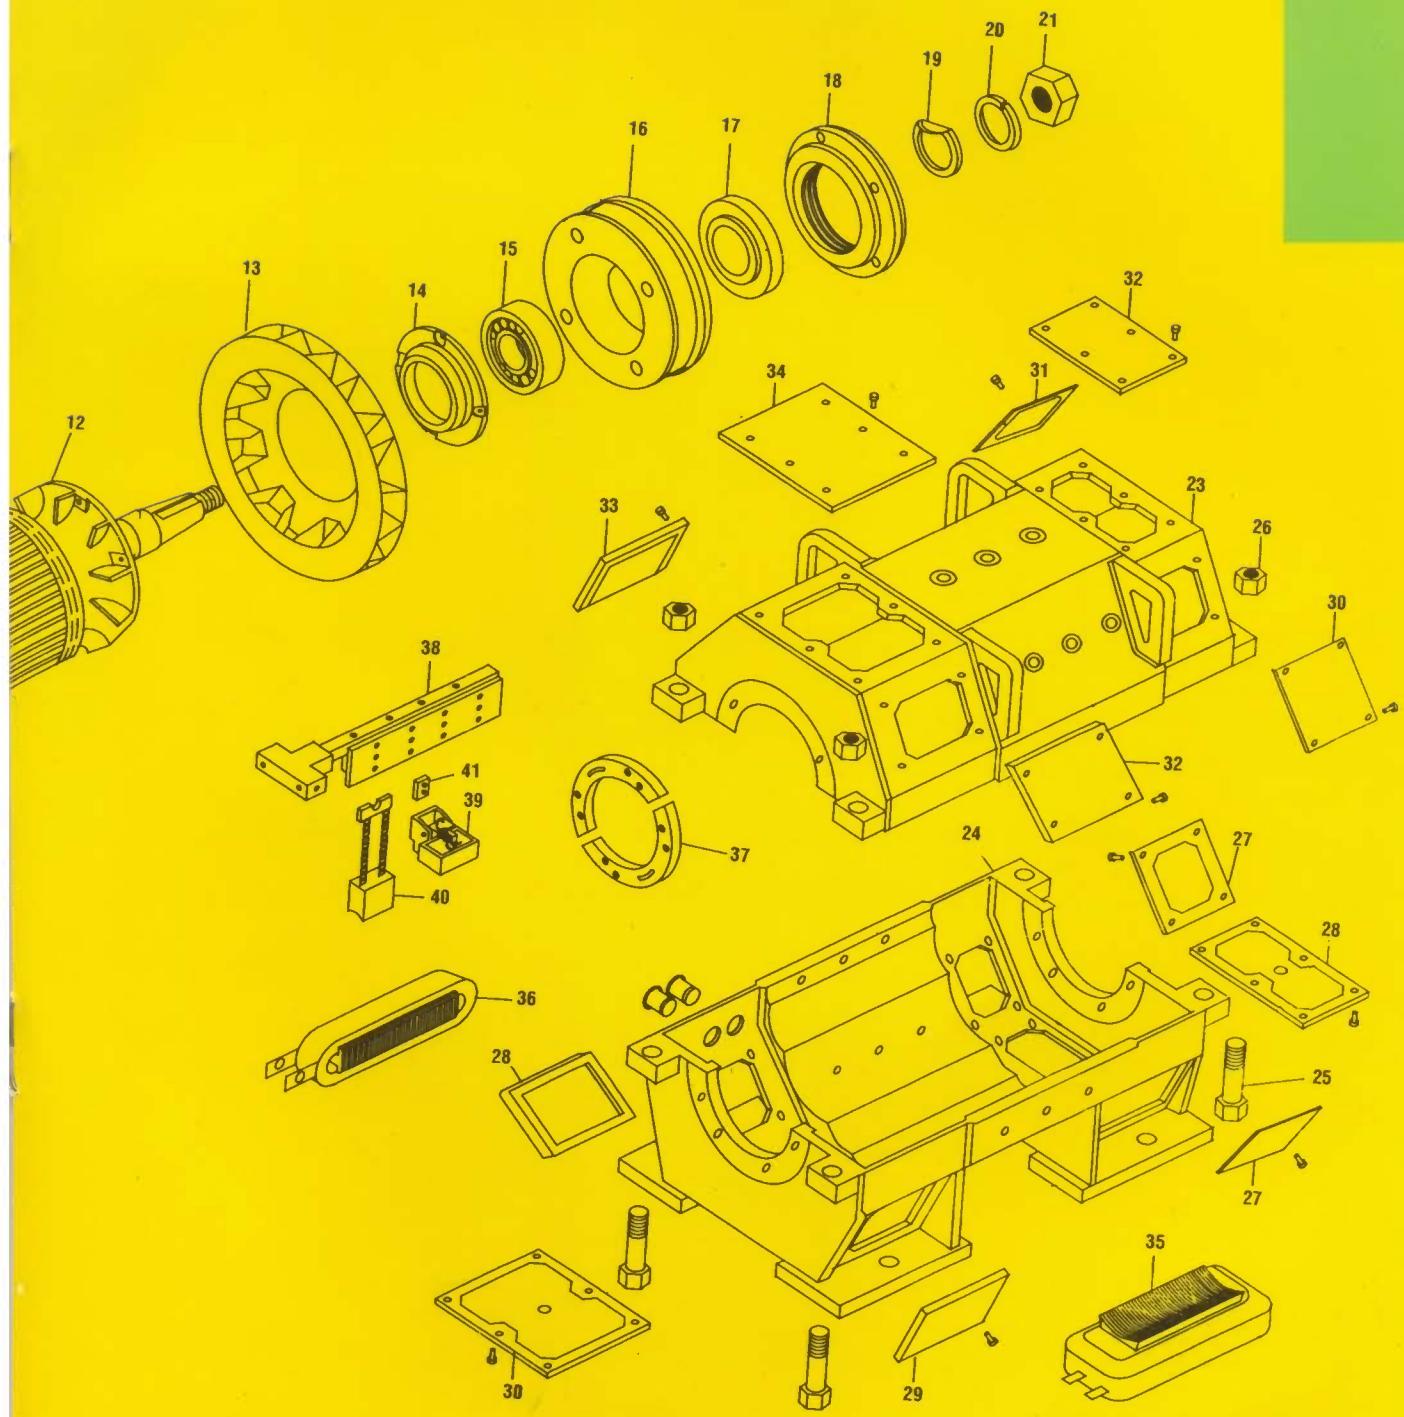

Thyristor converter source of supply is employed for testing all motors to ensure the satisfactory performance of the machine on both thermal levels and commutation; under influence of ripple content. Simulation of application conditions for acceleration, braking, reversals and starting can be demonstrated.

NOTES: 1) 808 TO 818 DATA IS FOR FORCE VENT CONTINUOUS OR TENV 1 HOUR.

2) MAXIMUM COMM. PRODUCT DEFINES THE LIMIT OF SPEED OBTAINABLE BY FIELD WEAKENING AT ANY SPECIFIC LOAD. EXAMPLE: FOR FRAME 814 REQUIRED LOAD TORQUE 5000 NM, MAXIMUM MOTOR TORQUE 6420 NM, CURRENT REQUIRED FOR MAXIMUM TORQUE = 1760A, CURRENT REQUIRED FOR 5000 NM = 1370A.

$$1500 \cdot 10^3$$

$$\text{MAXIMUM PERMISSIBLE SPEED} = \frac{1370}{60^2 (\text{KGM}^2) \cdot \text{SPEED (RPM)}}$$

3) MECHANICAL TIME CONSTANT (MS) =  $\frac{375 \cdot \text{ACCELERATION TORQUE IN KGM}}{\text{EXAMPLE: FRAME } 804}$

ARM. REF. 1  $\text{GD}^2=3.1 \text{ Kgm}^2$ , SPEED=725 RPM  
MAX TORQUE = 510 NM (60.14 KGM)

$$3.1 \cdot 725$$

MECHANICAL TIME CONSTANT =  $\frac{375 \cdot 60.14}{3.1 \cdot 725} = 100 \text{ MILLI SECONDS}$

$$375 \cdot 60.14$$

\* WEIGHT OF THE MACHINE INDICATED IS FOR IC 06 TYPE OF COOLING. \* TYPICAL  $dI/dt$  60 In/SEC.

## Laminated Yoke Motors Type LMDC

TECHNICAL PARAMETERS OF LAMINATED YOKE MILL DUTY MOTORS FOR FULL, HALF & QUARTER SPEEDS. ALL MACHINES ARE NONSPLIT COMPENSATED SHUNT SEPARATELY EXCITED MACHINES. THESE PERFORMANCE FIGURES ARE FOR COOLING SUCH AS 17, 37, 06, 0666, W37A86. ARMATURE REF: 1: FULL SPEED; 2: HALF SPEED; 3: QUARTER SPEED. TYPICAL AND SUBJECT TO CONFIRMATION IN SPECIFIC CASES.
